Savannah River National Laboratory

U.S. DEPARTMENT OF ENERGY • SAVANNAH RIVER SITE • AIKEN • SC

srnl.doe.gov

Benefits

- > 100% conversion of any type of biomass feedstock
- > No expensive or complicated pretreatment
- > Moderate temperature of operation

Applications

- > Production of hydrocarbons from biomass feedstock
- > Mixed biomass feedstocks
- > Wet biomass
- > Coal liquefaction

Contact Information

Conversion of Biomass by Efficient Base-Catalyzed Decarboxylation Reaction

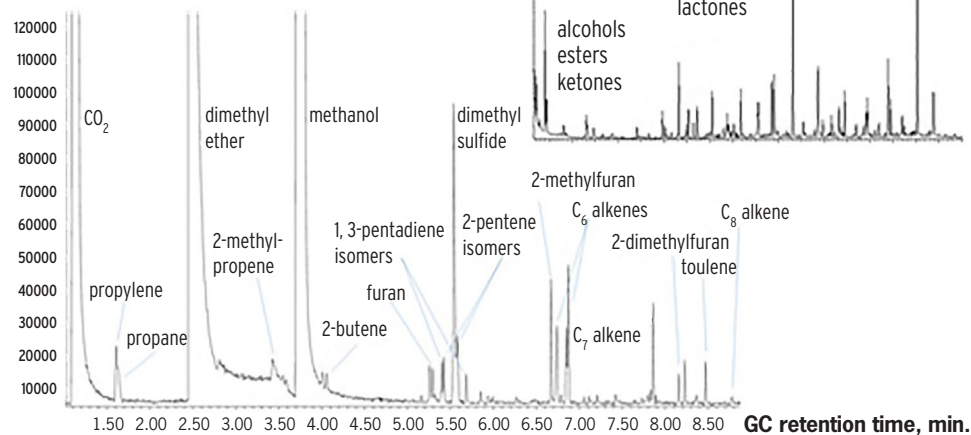

Technology Overview

Savannah River National Laboratory (SRNL) has discovered a highly efficient and universal biomass conversion method utilizing a base-catalyzed decarboxylation reaction. This method can efficiently convert all components of the biomass feedstock to liquid syncrude and carbon dioxide byproduct.

Savannah River National Laboratory®

Technology transfer

The Savannah River National Laboratory (SRNL) is the U.S. Department of Energy's (DOE) applied research and development laboratory at the Savannah River Site (SRS).

With its wide spectrum of expertise in areas such as homeland security, hydrogen technology, materials, sensors, and environmental science, SRNL's cutting edge technology delivers high dividends to its customers.

The management and operating contractor for SRNL is Battelle Savannah River Alliance, LLC. BSRA is responsible for transferring its technologies to the private sector so that these technologies may have the collateral benefit of enhancing U.S. economic competitiveness.

Description

Biomass has the potential to be a major source of renewable energy, but existing biomass conversion processes have proven limited in applicability. This invention comprises an efficient method to convert biomass by combining with a strong base and solvent to encourage the decarboxylation reaction. This reaction can occur at moderate temperatures (200-300°C) and achieves nearly 100% conversion for almost any type of biomass feedstock. The process can be applied to mixtures of different biomaterials in a single process. For instance, mixtures of coal with wood scraps can be converted in the same reaction vessel. The reaction mixture includes biomass feedstock, a base component, and a solvent in a stoichiometric amount that allows caustic pH to be retained in the mixture after consumption for carbon dioxide formation. The conversion reaction is primarily decarboxylation, hydrolysis and alcoholysis.

Intellectual Property

This technology and methods for its use have been granted U.S. Patent No. 10,392,565 B2 (August 27, 2019), "Conversion of Biomass by Efficient Base-Catalyzed Decarboxylation Reaction" and is available for licensing.

Partnering opportunities

SRNL invites interested companies with proven capabilities in this area of expertise to develop commercial applications for this process under a cooperative research and development agreement (CRADA) or licensing agreement. Interested companies will be requested to submit a business plan setting forth company qualifications, strategies, activities, and milestones for commercializing this invention. Qualifications should include past experience at bringing similar products to market, reasonable schedule for product launch, sufficient manufacturing capacity, established distribution networks, and evidence of sufficient financial resources for product development and launch.
